

FormBlocks is a revolutionary concrete forming system that has combined many of the best features of previous Plastic and Styrofoam systems, and added a number of innovative design features to bring you the most useful, functional, cost-effective, and ecologically benign construction device of the 21st century!

These blocks are made of **High Impact Polystyrene (HIPS)** and are able to utilize up to 40% recycled material depending on the intended application.

Creation of a wall form assembly is literally a *snap* using these blocks as they interlock with precision using a series of pins, tongues, and grooves. These features not only serve to stabilize the assembly in proper alignment, but also create an effective seal against leakage that could cause air pockets, and weaken the final structure.

These plastic blocks allow for the insertion of horizontal and vertical *reinforcement bars*, *dead-man anchoring*, *drainage*, and *capping* applications of all kinds. They can be made in a variety of sizes, finishes, textures, and colors to suit the particular needs of your project. Special components may also be employed to provide UV protection, fire retardant qualities, etc.

Furring strips, *electrical conduits*, etc., as well as other structural provisions can be installed prior to pouring.

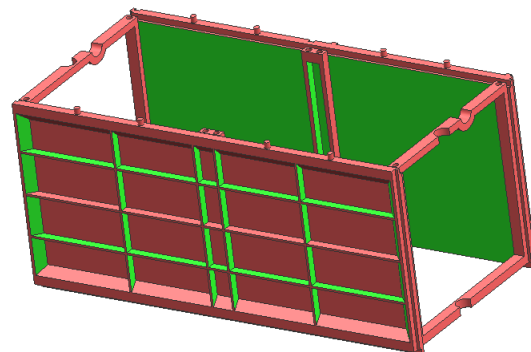

Complete installation instructions will be provided to cover all practical applications, as well as a list of required materials, accessories, and tools. However these blocks are designed for ease of use, and will be equally advantageous to contractors and do-it-yourselfers alike! For many applications you won't even need a footing!

Please be sure to contact us for additional information, we will be happy to work with you to make **FormBlocks** the answer to your next project!!
